

## Organic and Local

Redwood heartwood is naturally resistant to insects and decay, making it a great choice for organic farms and vineyards. This well-known California native species is a safe, non-toxic option for fencing and agriculture.

## Doweled Redwood

Doweled Redwood posts at the mill in Blue Lake, CA

### Untreated Durability

Redwood is well-known for its beauty and durability. This California native species has been used outdoors for hundreds of years. The heartwood is naturally resistant to insects and decay, making it a non-toxic and chemical free alternative to pressure treated wood. Doweled redwood posts are graded to contain at least 80% heartwood for natural in ground durability.

### Sustainable and Renewable

Extensive efforts have been made to conserve the Old Growth Redwood, and today the Redwood we consume is grown and harvested under the most stringent forestry regulations. Logging is done almost entirely on private commercial lands zoned specifically for timber production.

Our Redwood posts are milled out of the tops of trees from those logging operations, tops that are too small to produce lumber and were previously put into the waste stream. After producing the doweled redwood posts, the leftover wood particles are then

Processor sizing and sorting logs for the doweler

transported next door to supply a biomass-to-fuel cell system that converts the logging waste to essentially carbon-neutral power.

### Easy Disposal

Doweled Redwood posts are natural and chemical free, so they don't have any of the disposal issues associated with treated wood and metal. Trim ends can be simply thrown away or burned.
